GTCO CalComp's Personal Response System

GTCO CalComp, which recently acquired EduCue, is now distributing the company's Personal Response System (PRS). The system's typical installation can consist of from 40 to 400 pocket-sized wireless IR transmitters, in addition to at least 1 receiver connected to a PC or Mac. The system, which is used in education settings, uses IR wireless remotes to record student responses, process them and instantly display them in real-time feedback. These responses can be saved to a grade book and uploaded to a university-wide content management application. PRS handles answers to questions in a variety of types, including true or false, multiple choice and numerical.
